OBJECTIVE

Dynamic software developer with extensive experience in creating and optimizing systems, encompassing backend and frontend development, database design, and ERP consulting. Proficient in customizing and troubleshooting open-source systems, with a strong ability to generate complex reports using SQL queries. Experienced in system administration, ensuring robust and secure environments. Committed to delivering innovative solutions that meet business requirements, enhance functionality, and ensure security through comprehensive vulnerability scanning and resolution. Eager to leverage my multifaceted expertise in a forward-thinking development environment to drive success and efficiency.

EDUCATION

BACHELOR'S IN COMPUTER SCIENCE | Lebanese International University

2019 – 2022

GPA: 3.83

Certificates: CISCO NETWORK ACADEMY: CCNA 1, CCNA 2, CCNA 3

EXPERIENCE

Software Developer and Programmer at ITEC

2023-Present:

- Systems Development (ERP, ITSM, ANTI-THEFT...)
- System Administration
- API Development and Integration
- SQL Querying and Reporting
- Database Architect and Engineer
- Database Administration
- ERP Consultant
- Vulnerability Scanning and Assessments
- Customer Requirements Analysis
- Bug Resolution and Troubleshooting
- Project Management

2018-2022:

- Academic projects
- ESA Lab's initiatives
- Numerous paid projects for other students
- Teaching, delivering sessions in programming courses, particularly in Java, database management, data structures and networks

SKILLS

programming languages:

- Java
- Python
- C / C++
- PHP
- Java Script / TYPE SCRIPT
- C#

Web Development:

- HTML, CSS, Bootstrap
- Frappe
- Laravel / Node JS
- Angular / React / Vue
- Jinja / Twig (Templating Engines)

Databases & Tools:

- MYSQL
- SQL
- HeidiSQL – phpMyAdmin

Operating Systems:

- Linux

ERP Systems:

- ERPNEXT
- Administration
- Accounting
- Inventory
- Selling, Buying
- HR
- Manufacturing
- POS

Artificial Intelligence:

- Ai API Integration (gpt-4)

Robotics:

- Robotics (Arduino)

Networking:

- Cisco

Cybersecurity &

Vulnerability Assessment:

- Openvas
- Nikto
- Wireshark
- Nmap
- Trivy

Mobile Development:

- Android Studio

Version Control:

- Git – GitHub

PROJECTS

University Projects:

- **GYM Management System:** The GYM Management System is a comprehensive web-based platform designed to streamline gym operations, including member registration, class scheduling, and trainer assignment. It has been enhanced to support subscriber registration and manage subscription validity, allowing the system to automatically handle plan durations and expiry notifications. Additionally, it features a product and service showcase for browsing and purchasing fitness items and personal training sessions, a section to display training programs, and a news section for publishing gym-related updates, events, and announcements—transforming the platform into a centralized hub for both gym members and administrators.
- **Chalet Renting and Hosting System:** The Chalet Renting and Hosting System is a user-friendly web platform that allows property owners to list and manage their chalets or homes with ease, offering full control over property details, availability, and communication. On the user side, visitors can browse available listings using dynamic filters such as location, price range, and amenities to quickly find the most suitable options.
- **Notes Application:** android mobile notes application, designed to streamline the process of creating, organizing, and managing notes.

- **Restaurant Search and Menu Access:** The Restaurant Search and Menu Access web application is designed to host and centralize restaurant menus, allowing users to easily search for restaurants by location, rating, or name. Once a restaurant is found, users can access detailed information and view its full menu directly from the platform.
- **Restaurant Search and Menu Access:** The Picture Matching Puzzle App is a simple yet engaging Android game where users match pairs of related images to complete levels.

Professional Projects:

- **ISOFT ERP:** This project is based on the open source erp system **ERPNext** and has been extensively customized to address the unique requirements of various businesses. My role includes translating customer requirements, ideas, and challenges into effective digital solutions through customization and extension of core modules. I integrate the system with third-party services and external platforms such as payment gateways, BI tools, and e-commerce applications like Shopify. Additionally, I incorporate APIs like OpenAI to assist users by converting natural language questions into SQL queries when necessary, delivering AI-generated responses, and providing guidance on system usage. I develop complex queries and scripted reports, along with advanced print formats to fulfill user needs and ensure compliance with AJT regulations, including SAFT export. Furthermore, I design and implement automation, create new modules, and tailor workflows to support diverse business types. Continuous system customization, improvements, and bug fixes are part of my daily work, backed by deep expertise in accounting, inventory, and various ERP modules to deliver robust, business-aligned solutions.
- **ERP lite:** A simplified version of the full ERP system, designed to cover the essential business processes of small companies with a focus on usability, speed, and scalability. Includes integration with the country's SAFT (Standard Audit File for Tax) regulations, along with compliance to AJT (Angolan Tax Authority) requirements and rigorous data validation to ensure accurate and auditable records.
- **ITSM:** Designed and implemented an IT Service Management system to streamline IT operations, service requests, incident tracking, and asset management.
- **Vulnerability assessment:** Conduct routine security scans and assessments of infrastructure and systems to ensure safety and compliance. Utilize tools such as OpenVAS, Nikto, Wireshark, Trivy and Nmap to detect and mitigate vulnerabilities effectively.
